	(a) Intervention	(b) Damage	(c) Output
General model		Allocation $p \in [0, 1]$ $\mathcal{M}_1: \quad \dot{w}_1 = p\varphi(v)$ $\mathcal{M}_2: \quad \dot{w}_2 = (1-p)\varphi(v)$ True model unknown.	Rate of measured output $y(t)$ $\dot{y} = f(y) + v - c_i h_i(w_i)$
Section V instance			
After withdrawal $t \geq T_w$	**No further exposure** $v = 0 \quad \Rightarrow \quad \varphi(v) = 0$	**Accumulated damage remains** $w_i(t) = w_i(T_w)$	**Output continues to evolve** $\dot{y} = f(y) - c_i h_i(w_i(T_w))$
